

Daniel Pybus Sollid Project management CA

Report 18.11-18

For this task I first decided to find out what would be needed on my team. Since the task asks for us to take the pictures ourselves and the client wanted to use the pictures and films for more of their branding I figured that I would need someone that could both take pictures for the site and create a quick video telling us about the company and what they are creating. I chose my friend Magnus for this, he is a really good photographer and has helped me when I created commercials when that was my job in Skien.

After Magnus I thought that it would make sense to have someone on my team that could focus on the design aspects. I chose one of my other friends for this as I know he also is a really good designer and has a real passion for it. This person is Anders, he is currently getting his bachelors at Høgskolen Kristiania and I know that we work well together and he's able to produce quality and has a lot of knowledge about design, both user design and a more artistic version of it.

Then it was over to find a programmer, I know a lot of programmers but the only one I know of that knows CSS and HTML as well as C# and C++ is my friend Adrian. I went with Adrian instead of the people in class for three reasons, I have worked with him before and we know about each others good and bad habits, he knows how to program with more complex languages then the mock up language that we know so he would be able to work more efficiently and know what to search for if something were to break. I also do not know if we were allowed to use people from the class.

Then lastly I put myself as the team lead. In this scenario I would be working as a writer and help come up with slogans and flavour text for the website. I chose myself to do this because of my past as a freelance journalist. I would also be incharge of finding out what the client would want aswell as create 3D-renders of the product. Like coke does source "<https://www.youtube.com/watch?v=FIz5eulIMQo>".

The gannt chart was created using Monday.com. The site reminds me of Trello, but I prefer the layout that monday.com has. I chose since it's quite easy to use and when you add team members you can just give them the task they would need instantly. It also reminds me of scrum with the "ice-box-thing" it has going for it. And by that I mean the "Status" bar, which would be really helpful for a team leader. Monday also gives you the opportunity to have severall different projects going simultaneously which would benefit a bigger company or it could also help when going back to see how the team had evolved during a certain time period.

When working on my bachelor I realised how bad it was that the team didn't have good communication so in this hypothetical scenario I would wish that the whole team would update it whenever they took lunch or when they were done for the day.

Again the gannt-chart created would probably have to be adjusted quite a bit since it was created by myself. Which would be quite easy with Monday's easy to use interface. To deliver the files I would use Google disk, since I could just create a new folder and people would be able to release their new versjions in the folders.

İn my Gantt-chart I put the monday of the second week to work with feedback. The thoughtprocess there would be to deliver the website created in week 1 and then work with what the client wanted changed that monday and use the rest of the week to make the website more responsice, quicker loadtimes and finalize it.
